

配置文档

前言

- 本项目为论文Mining Fix Patterns for FindBugs Violations的部分实现源代码，我们使用的是其中自动收集警告数据集的部分。警告收集以及警告跟踪的方法原理在论文2.1、2.2、2.3节中，可自行查看。若收集到的数据不符合需求，可自行对源代码进行diy，以获取所需的警告数据。本文档仅提供一种项目配置方案，如有不同需求，可自行配置。

项目运行环境

- Linux (Ubuntu 18.04)
- Jdk 1.8
- Maven 3.6.3
 - 需要更换阿里云镜像
- Neo4j Community 3.5.X
 - 注意jdk和Neo4j版本要相互对应，如：最新版本的Neo4j需要jdk11，Neo4j 3.5.X需要jdk 1.8

配置流程

- 项目结构如图所示，其中violation-collection为本项目进行配置的警告数据收集部分。

```
(base) ~/findbugs-violations master ± tree -L 1
.
├── GitTraverse
├── Mined Fix Patterns
├── Parser
├── PatternMining
├── README.md
├── data
├── gumtree
├── parsing-utils
├── repo-iterator
├── simple-utils
└── violation-collection
```

- 由于violation-collection依赖于simple-utils、repo-iterator、parsing-utils，需要先对这三部分进行构建，最后对violation-collection进行构建。
 - 进入simple-utils目录
 - 执行"mvn clean install -DskipTests"
 - 进入repo-iterator目录
 - 执行"mvn clean install -DskipTests"

- 进入parsing-utils目录
- 执行"mvn clean install -DskipTests"
- 进入violation-collection目录
- 执行"mvn clean install -DskipTests"
- 在构建过程中，若出现依赖无法解析，可根据groupId到<https://mvnrepository.com/>进行搜索，例如：
 - 无法解析该依赖

```
<dependency>
  <groupId>org.eclipse.core</groupId>
  <artifactId>org.eclipse.core.runtime</artifactId>
  <version>3.10.0.v20140318-2214</version>
</dependency>
```

■ 下载jar包

Home » org.eclipse.core » org.eclipse.core.runtime » 3.10.0.v20140318-2214

Core Runtime » 3.10.0.v20140318-2214

Core Runtime

```
<!-- https://mvnrepository.com/artifact/org.eclipse.core/org.eclipse.core.runtime -->
<dependency>
  <groupId>org.eclipse.core</groupId>
  <artifactId>org.eclipse.core.runtime</artifactId>
  <version>3.10.0.v20140318-2214</version>
</dependency>
```

☒ Include comment with link to declaration

Note: this artifact is located at [Eclipse Releases](#) repository (<https://repo.eclipse.org/content/groups/releases/>)

- 执行命令"mvn install:install-file -Dfile=xxxxx.jar -DgroupId=xxxxx -DartifactId=xxxxx -Dversion=xxxxx -Dpackaging=jar",其中：
 - Dfile: 要安装的jar的本地路径
 - DgroupId: 要安装的jar的groupId (org.eclipse.core)
 - DartifactId: 要安装的jar的 artifactId (org.eclipse.core.runtime)
 - Dversion: jar版本 (3.10.0-v20140318-2214)
 - Dpackaging: 打包类型 (jar)
- 启动neo4j数据库
- 创建repoDir和workingDir两个文件夹，其中repoDir存放apache项目，workingDir存放生成的报告等数据，文件结构如下图所示：
 - repoDir

(base) ~/repos ➤ tree

```
.
├── repos-a
│   ├── jmeld
│   ├── jmeter
│   └── maven-dependency-plugin
├── repos-b
├── repos-c
├── repos-d
└── repos-x
```

- repos目录下，按字母顺序有若干repos-x，存放apache项目。
 - workingDir

(base) ~/workings tree

```
.
├── workings-a
│   ├── conf
│   │   ├── jmeld
│   │   ├── jmeter
│   │   └── maven-dependency-plugin
│   ├── log
│   │   ├── jmeld
│   │   ├── jmeter
│   │   └── maven-dependency-plugin
│   ├── reports
│   │   ├── jmeld
│   │   ├── jmeter
│   │   └── maven-dependency-plugin
│   └── shell
│       ├── jmeld
│       ├── jmeter
│       └── maven-dependency-plugin
├── workings-b
├── workings-c
├── workings-d
└── workings-x
```

- workings-x和repos-x一一对应，每个working-x中都包含了conf、log、reports、shell四个文件夹，分别存放各个项目的配置信息、日志、警告报告、shell脚本，conf、log、reports、shell都可以通过运行scala脚本自动生成，在下文中会提及。
- 配置findbugs-violations/violation-collection/src/main/scala/edu/lu/uni/serval/alarm/util/AutoExpConfShellWriter.scala
 - 该scala脚本用于根据repoDir中已有的项目，在workingDir中生成对应的conf、log、reports、shell。

- 如图所示:

```
/**
 * @author darknsw
 */
object AutoExpConfShellWriter
{
  /**
   * args(0): /root/repos/repos-a
   * args(1): /root/workings/workings-a
   */
  def main(args: Array[String]): Unit =
  {
    if(args.length < 2)
    {
      Console.err.println("Usage: $java -cp \"$LIBS/*\" THIS.class$ [repoRootDir] [workingDir]")
      return
    }

    val reposDir = new File(args(0))
    val reposPath = reposDir.getCanonicalPath

    val workingDir = new File(args(1))
    val workingDirPath = workingDir.getCanonicalPath

    val tmpDir = "/tmp/exp/"
    val javaRT = "/usr/lib/jvm/java-1.8.0-openjdk-amd64/bin/java"
    val libDir = "/root/findbugs-violations/violation-collection/lib:/root/findbugs-violations/violation-collection/ta
    val confDir = new File(workingDir + "/conf")
    val shellDir = new File(workingDir + "/shell")
  }
```

- 输入参数: repoRootDir, workingDir, tmpDir
- tmpDir为处理过程中数据临时存放文件夹, 可任意指定
- javaRT为jdk所在路径
- libDir存放该项目运行所需的所有库
 - 可执行"mvn -DoutputDirectory=./lib -DgroupId=edu.lu.uni.serval -DartifactId=violation-collection -Dversion=0.1-SNAPSHOT dependency:copy-dependencies"将所需第三方依赖打包进lib文件夹中, 其中DoutputDirectory为输出的目标文件夹, DgroupId、DartifactId、Dversion为violation-collection对应的pom.xml的项目信息, 如图所示:

```
<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/maven-v4_0_0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>edu.lu.uni.serval</groupId>
  <artifactId>violation-collection</artifactId>
  <packaging>jar</packaging>
  <version>0.1-SNAPSHOT</version>
  <name>violation-collection</name>
```

- 还需将编译violation-collection项目生成的violation-collection-0.1-SNAPSHOT.jar放入libDir中。
- 在生成shell脚本后, 可通过执行shell脚本, 调用AlarmExpExecutor对仓库中的apache项目进行自动编译, 并使用spotbugs进行扫描, 扫描结果存放在reports文件夹中,也可自行修改接口对AlarmExpExecutor进行调用。

- 配置violation-
collection/src/main/scala/edu/lu/uni/serval/alarm/util/db/graph/neo4j/VioDBFacade.scala
 - 如图所示:

```
package edu.lu.uni.serval.alarm.util.db.graph.neo4j

import ...

object VioDBFacade
{
    var viodbURI = "bolt://[redacted]:7687"
    var user = "neo4j"
    var passwd = "[redacted]"
    var driver: Driver = _
    var session: Session = _
}
```

- 配置viodbURI, user, passwd
- 配置violation-
collection/src/main/scala/edu/lu/uni/serval/alarm/tracking/TrackingExecutorByProject.scala
 - 该scala脚本对同一项目在不同的commit间进行警告跟踪, 构建警告生命周期, 若想了解警告跟踪, 可详细阅读该部分源码
 - 如图所示:

```

package edu.lu.uni.serval.alarm.tracking

import ...

object TrackingExecutorByProject extends LazyLogging
{
  /**
   * example
   * args(0):maven-dependency-plugin
   * args(1):/root/workings/workings-a/reports
   * args(2):/root/repos/repos-a/
   */
  def main(args: Array[String]): Unit =
  {
    try{
      internal(args(0), args(1), args(2))
    } catch
    {
      case e: Throwable => logger.error(message = "Unknown Error", e)
      Runtime.getRuntime.exit(127)
    }
    finally
    {
      Runtime.getRuntime.exit(0)
    }
  }

  def internal(projectName: String, alarmRootPath: String, repoRootPath: String): Unit =
  {

```

- 输入参数: projectName, alarmRootPath, repoRootPath, 详见截图中注释的example
- violation-collection/src/main/scala/edu/lu/uni/serval/alarm/util/TrackingHelperUtils.scala
 - 若按照上文描述创建项目仓库, 则可使用该scala脚本创建一个.map文件, 该文件保存了项目名, 以及该项目对应仓库信息。
 - 脚本代码如下所示:

```

package edu.lu.uni.serval.alarm.util

import ...

object TrackingHelperUtils
{
    def main(args: Array[String]): Unit =
    {
        mapProject2Pack( mapFilePath = "prj-pack.map", pathTemplate = "/root/exp/violation/repos/repos-%s")
    }

    def mapProject2Pack(mapFilePath: String, pathTemplate: String): Unit =
    {
        val mapFile = new File(mapFilePath)

        val index = 'a'

        0 to 20 foreach { x =>
            val indexChar = (index + x).toChar
            println(indexChar)

            val reportRootDir = new File( pathTemplate.format(indexChar) )

            val prjList = reportRootDir.listFiles().filter(_.isDirectory())
            prjList.foreach( x => FileUtils.write(mapFile, FilenameUtils.getBaseName(x.getCanonicalPath)
                + ":repos-" + indexChar + "\n", encoding = "UTF-8", append = true) )
        }
    }
}

```

- .map脚本数据信息如图所示：

```

maven-dependency-plugin:repos-a
jmeter:repos-a
jmeld:repos-a

```

- violation-collection/src/main/scala/edu/lu/uni/serval/alarm/tracking/FixedAlarmCollector.scala
 - 该scala脚本从neo4j数据库中导出已修复警告信息

- 脚本代码如图所示：

```
import ...

object FixedAlarmCollector extends LazyLogging
{
  def main(args: Array[String]): Unit =
  {
    try{
      collectFixedAlarms(args(0), args(1), args(2), args(3), args(4))
    } catch
    {
      case e: Throwable => logger.error(message = "Unknown Error", e)
      Runtime.getRuntime.exit(127)
    }
    finally
    {
      Runtime.getRuntime.exit(0)
    }
  }
  // collectFixedAlarms("fixed-alarms.list",
  //                     "/root/repos/repos-%s/%s/.git",
  //                     "/root/findbugs-violations/violation-collection/prj-pack.map",
  //                     "vtype-stat.csv",
  //                     "summary-project-vtype.csv"
  // )
}
```

- 输入参数： outputPath, repoPathTemplate, mapFilePath, vtypePath, summaryPath, 其中：
 - outputPath:导出正报警告数据文件名
 - repoPathTemplate:仓库路径模版，可参考截图的注释样例
 - mapFilePath:上文提及由脚本生成的.map文件路径
 - vtypePath:导出正报警告类型统计信息
 - summaryPath:导出各项目正报警告类型统计信息
- 若只需要导出单个项目正报警告数据信息，请自行修改接口
- violation-collection/src/main/scala/edu/lu/uni/serval/alarm/tracking/UnfixedAlarmCollector.scala
 - 该scala脚本从neo4j数据库中导出为修复警告信息

- 脚本代码如下：

```
package edu.lu.uni.serval.alarm.tracking

import ...

object UnfixedAlarmCollector
{
  def main(args: Array[String]): Unit =
  {
    doTask(fixSummaryPath = "fixed-summary-project-ytype.csv", args(0))
  }

  def doTask(fixSummaryPath: String, project: String): Unit =
  {
    val summaryFile = new File(fixSummaryPath)
    val summaryList = CSVReader.open(summaryFile).all()

    // prepare project to pack map
    val prj2PackMap = TrackingHelperUtils.readProject2PackMap(mapFilePath = "/home/darkrsw/repo/fal")
    println("prj2pack map size: " + prj2PackMap.size)
    val repoPathTemplate = "/mnt/archive1/data/violations/repos/repos-%s/%s/.git"

    //val project = "Activiti-Activiti"
    val outFile = new File(s"unfixed-$project.csv")

    val pack = prj2PackMap(project)
    val repoPath = repoPathTemplate.format(pack, project)
    val tracker = new AlarmTracker(project)
    tracker.initGitRepo(repoPath)
  }
}
```

- 输入参数：fixSummaryPath, project, 其中：
 - fixSummaryPath:FixedAlarmCollector中summaryPath对应文件
 - project:项目名
- 其他路径请自行配置
- 主要使用的脚本已经介绍完毕，其他如有需要，请自行配置或对接口、源码进行调整
